

AI Summary

Title: Ecommerce Recommendation Algorithm

Subtitle: Improving accuracy and diversity in ecommerce recommendations

In the booming world of ecommerce, a novel recommendation algorithm based on link prediction is proposed to enhance accuracy and coverage. By projecting the user-item data into a single-mode network, potential links are predicted based on similarity, resulting in improved performance compared to traditional algorithms. The algorithm addresses the limitations of existing systems by considering both strong and weak relationships in the dataset, leading to more diverse recommendations.

Key Points:

- Novel algorithm based on link prediction for accurate and diverse ecommerce recommendations
- Projected user-item data into a single-mode network for efficient link extraction
- Higher accuracy and coverage demonstrated through experiments on real ecommerce datasets
