Novel Ecommerce Recommendation Algorithm Based on Link Prediction

Binzhou, China — June 6, 2021

A groundbreaking research paper by Guoguang Liu from Binzhou University introduces a novel ecommerce recommendation algorithm based on link prediction. This algorithm aims to address the limitations of traditional recommendation algorithms in accuracy and diversity.

The research paper proposes a method that imports user-item data into a distance formula to calculate attribute similarity, followed by projecting the bipartite graph network (BGN) into a single-mode network (SMN) for efficient link extraction. By predicting potential links based on similarity, the algorithm has shown higher accuracy and coverage in experiments with real ecommerce datasets.

This innovative approach offers a promising solution to enhance the efficiency and effectiveness of ecommerce recommendation systems, providing policymakers with valuable insights for improving user experience and boosting online sales.

About Binzhou University: Binzhou University is a leading institution in China dedicated to excellence in education and research.
