

AI Summary

Title: Efficient Ecommerce Algorithm

Subtitle: Improving accuracy and diversity in recommendations.

This research introduces a novel ecommerce recommendation algorithm based on link prediction, enhancing accuracy and coverage. By projecting the bipartite graph network into a single-mode network, potential links are predicted with higher precision. Real ecommerce data experiments have shown superior performance compared to traditional algorithms.

Key Points:

- Novel algorithm enhances accuracy and coverage
- Projection into single-mode network improves efficiency
- Outperforms typical recommendation algorithms in real datasets
